What everyone does not know is that the CE2B is the exact same pedal with only changes in component values. The CE2B also has a mix control to dial in exactly how much chorus you want. <http://www.magnachip.co.kr/userfiles/20200910081028.xml>

The Supreme Mod kit for the Boss CE2B includes all the parts and detailed instructions with color photos for all the following mods. CE2 Conversion Turn your CE2B into a CE2 with a mix control. Leslie Swirl Mod Increases the maximum speed available for a very convincing fast Leslie tone. All the slow speeds are still available but now the range is increased. Deep Mod Increases the maximum depth of the effect. Hi Fidelity Mod Change out the opamp with a socketed high quality audio grade Burr Brown opamp and change out the input and output caps with high quality film caps for greater retention of tone and lower noise. Takes a mass produced effect and gives it the sonic quality of a boutique chorus pedals costing twice as much. WARNING Performing this mod will void any warranty your pedal may have. This is a kit to modify your pedal and there is not a pedal included in this auction. Note Images are for reference only. Component substitutions of equal or greater quality will be made due to market availability. Please contact us if you have any questions. SMG 5.0 out of 5 stars All I gotta say is WOW. I installed every mod offered in this kit, and the CE2B now sounds every bit as good as my CE2. Also had the ability for much deeper chorus, which is cool for certain tunes. You need to be decent with a soldering iron to modify the CE2B, but the instructions provided are super clear and easy to follow! The CE2 builds on the legacy of the CE1 with reduced features mono output instead of stereo, no vibrato mode, no integrated power supply, no level and no intensity controls.

The CE2 has higher input impedance and boosted mid frequencies, both arrangements very suitable for electric guitars. Roland stopped marketing the CE2 in 1982, however still produced until 1990. There are basically 3 versions of the pedal Some early standalone stompboxes like VibraChorus and UniVibe by ShinEi were released in 1960s, creating some degree of phase shifting or chorus modulation. The CE2 follows the same tonal response. The usual delay times are around 5 to 50ms and LFO oscillating frequencies are up to 20Hz. CE2 uses triangle LFO waveforms. There are several possibilities Hearing both signals together the chorus effect is created. The input and output circuits use the dual opamp uPC4558C IC, while the LFO is implemented with the help of a TL022LP opamp. Some additional active filtering is applied using SallenKey transistor stages. The effect response is commanded using two controls The top of the board contains all the pads to attach the cables to be connected to the jack connectors, potentiometers, and the footswitch. It also carries other benefits like the number of components used in the pedal and using a light indicator and a poweron LED at the same time. The JFET Bypass Switch enables two possible toggle configurations The VR 3 potentiometer is able to finely trim the 4.5 voltage sometimes due to the loading of all stages, the 4.5 voltage might suffer some offset, the BBDs are sensitive to the bias, adjusting VR3 will bring maximum clean headroom. The 9V regulated line will bring the supply for the Bucket Brigade Stage, rejecting highfrequency harmonics which are especially harmful in BBDs signal processing due to the clocking noise of the MN3101 clock driver. This pedal was originally designed for an external 12V ACA supply adapter. The series resistor R53 and diode D5 between the minus input on the power jack and ground are used to reduce the internal voltage supply.

<http://eco-region31.ru/3m-8511-manual>

The voltage drop over the resistor and diode will underpower the pedal making the poweron LED

glow faintly. One easy solution is to use a daisy chain cable together with another standard pedal. The link between the two pedals will short the resistor-diode circuit and the pedal will receive full power. It also separates the guitar from any pedal DC potential, protecting the pickups in case of circuit failure. But applying the same filtering to the delay signal, the output signal will reduce any hiss acquired via the delay path. Boss CE2 uses the opamp inverting architecture. It is also implemented over the 4558 dual opamps and designed to attenuate the magnitude of the high frequencies with respect to the mid-low frequencies. This filter takes the unnatural sounding pre-emphasized audio and turns it back into its original response. These are generated at integer multiples of the sample rate. The ideal filter specification is the same as that for the anti-aliasing filter. In this way, the input signal is band-limited to prevent aliasing. The cutoff frequency can be calculated as The output signal must be band-limited, to remove the clock noise and prevent aliasing meaning Fourier coefficients being reconstructed as low-frequency waves, not as higher frequency aliases. The cutoff frequency can be calculated as After the delay stage, slightly more bass pass through the circuit. At the same time, a Low-Frequency Oscillator LFO is needed to drive the MN3101 in order to generate the variable delay time which is the gist of the chorus effect. It is used to discharge the C 22 47pF timing capacitor, which is charged through the R 38 150K resistor. Indeed, Q 5 together with the MN3101 will oscillate by itself at a constant frequency without Q 4 and its associated components. The cycle repeats at an ultrasonic rate. Immediately after C 22 discharge, the diode D1 is needed to isolate the output of Q4 transistor.

<http://gulzarihacegandergisi.com/images/carenado-mooney-m20j-manual.pdf>

As the LFO cycles, the delay time goes up and down and therefore the delayed audio pitch slightly shifts up and down. Some ticking can be mixed with the audio when the LFO produces the rising or falling edge of a square wave and there is a very sudden surge in the current. This simple circuit provides a variable frequency triangular waveform whose amplitude is also variable. The oscillation frequency can be calculated following the formula of the Triangle Oscillator by Ron Mancini The action of VR2 will modify the steepness of the ramp and therefore the amplitude or depth at a fixed frequency. The most significant difference is the additional knob E. LEVEL to control the blend of the direct and processed signal. Also, a component of the highpass filter, the C14 capacitor, located just before the mix control, is changed from 0.033uF to 0.012uF.

<http://jackson-pr.com/images/carenado-cessna-182-manual.pdf>

A CE2B with the E.Level knob turned fully clockwise will sound almost like the CE2, but with the chorus effect applied to slightly higher frequencies. When it's turned fully clockwise, it increases the amount of the chorus effect but it also increases the corner frequency the low spectrum of the guitar sound will remain unaffected. On the minimum setting, lower frequencies will get through from the delay line, but with a smaller amplitude. The CE2B with the E. Level knob turned to the max. First, change C14 0.033uF to 0.012uF. The level knob acts as a short if set to the max., so the removal is

not necessary, just remember to always keep it turned fully clockwise. Alternatively, you can remove the wires that go to it and solder the 47k yellow, violet, orange, gold resistor directly in the board. See the table for all the differences between the two models. All the slow speeds are still available but now the range is increased. The stock CE2B can be a little on the subtle side, with this mod you have greater maximum depth, without losing any of the more shallow setting. Change the stock input and output capacitors with high quality capacitors for greater retention of tone and lower noise. Take a mass produced effects pedal and give it the sonic quality of a boutique chorus pedal costing for far less. Why you ask We are no. All sales are final. We cannot be held responsible if you ruin your pedal. I got ripped off by a buyer of my TR2 mod. Said he wasn't happy with the mod so I offered to buy the TR2 from him. When I received the pedal it was nonfunctioning. He had drilled the hole for the pot in the wrong place piercing the ribbon going to the depth pot and completely pulled 4 traces from the PCB. And he wanted to know why the mod sounded bad.

Because of this I will no longer issue refunds of any type on mods. If you do not have the skills required to perform the mod then please let us do the mod for you. Monte Allums Even though its no longer in production there are tens of thousands of these pedals being used by pros all over the world. What I have done with this mod is improve several areas in the circuit. First, we have modified the voltage giving the pedal more headroom and improving the quality of the effect. The pedal can now be used with a standard Boss PSA power 9V adapter. We also replace the main opamp with a OPA2134PA Burr Brown opamp. This is a very HiFi Low Noise opamp and will add clarity and fullness to the effect. This will add clarity, fullness and a much more focused tone to the circuit. We also modify a resistor increasing the brightness of the LED. We also supply you with a 3mm BiColor LED that flashes with the rate of the effect. We modify a capacitor that doubles the rate of the chorus effect to give you a super fast chorus effect while preserving the slow rate. The richness of the actual chorus effect has also been enhanced. If you are looking for an absolutely beautiful, rich, smooth and lush chorus effect this is the mod for you. A great sounding analog chorus just got 10X better. I have added a BiColor LED that will possess 2 functions. One will blink at the Rate the Chorus effect is set to by the Rate knob and the other will show when the effect is engaged. You can purchase the BiColor LEDs here. You can visit Seans band here. Thank you Sean for letting me use these clips. Man, what great tone Sean, Awesome! It's just the nature of Electrolytic caps. Sometimes the leaking is actually visible. But Electrolytic caps can look okay and still be faulty. By replacing Electrolytic caps in older pedals you can actually improve the overall effect of that pedal.

Honestly I was skeptical until I received an email from a client that was having issues after he modded his Boss BF2 with one of my kits. He said the flange effect was barely noticeable. A couple of weeks later I received another email from the same client. The client said he had solved the issue by replacing all the Electrolytic caps in his BF2. This peaked my interest so I started experimenting. I was astonished how some of my older pedals benefited from the cap upgrade. Noise seemed to be reduced and clarity and presence of the effect were enhanced. I am now offering these Cap Upgrade Kits for many of the pedals I offer kits for. In some cases some of these caps are already upgraded in the kits that I offer. But I am offering kits that replace all the Electrolytic caps for those that have not purchased my kits. They will benefit from upgrading the Electrolytic caps that I do not replace in my kits. You'll find that some of these same caps are already replaced in the kits I offer. It's a win win all around for those that want the maximum benefit when upgrading their pedals. But I didn't stop there, when possible I have upgraded these Electrolytics with Metal Film and Tantalum. Not only do these caps have tighter tolerances but they will also last the life of the pedal. The CE1 was released 1976 and contained the exact same circuit as the Roland Jazz Chorus JC120 Amp. The CE2 builds on the legacy of the CE1 but isn't identical. The middle region is boosted in the CE2 compared to the CE1. According to the design engineers this may be because the CE1 had a lower input impedance. Silver screw ! Made in Japan, 1980. Beloved for its rich, liquid tone and super simple operation, this chorus pedal has been used on many, many hit records over the last four decades. Since its release in the mid 1980s, the CE2 has seen many revisions to its design, and while they appear nearly identical, some versions have some significant circuitry and sonic differences. Most tone gurus agree that the version built in Japan during the late 80s and early 90s is the finest example, which is why Brainworx selected this revision as the basis for their model.
